

## ABSTRACT

In a method and an information system for verifying electronic shipping-voucher and shipping data sent by a sender (in particular a supplier) to a receiver (in particular a system provider or a plant), faulty data records are automatically detected or recognized and displayed in a defined access area of a central information system. The sender is able to inspect this defined access area, which contains the faulty data records sent by him, and modify the data records it contains. In this manner, the sender receives, on-line, a check-back indication or acknowledgment of the quality of the data records sent by him, and, if indicated, is able to make a correction. The sender's access to his defined access area may occur over the Internet.
